

Wild Atlas Coloring Book

Cozy Critters

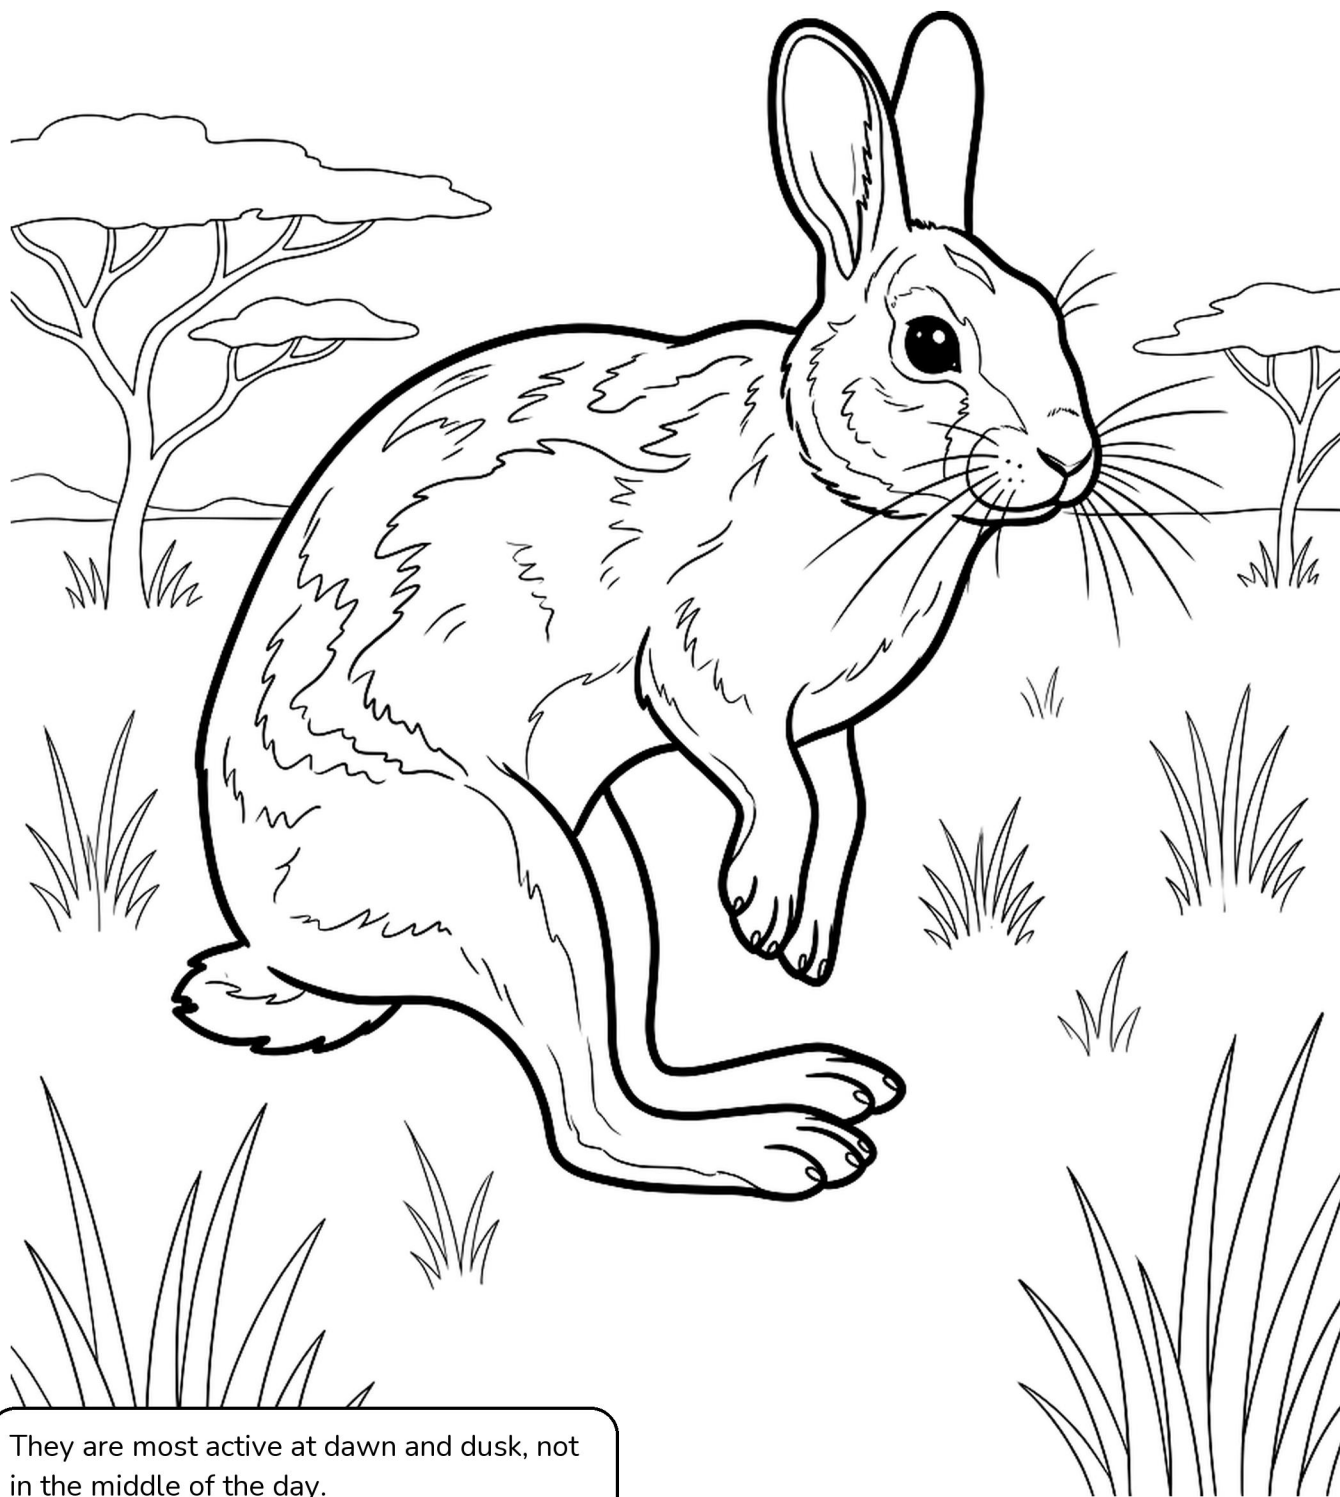

Welcome to the world of cozy critters! These are the small, friendly animals that people love to keep as pets. Some are soft and furry, some have scales or shells, and some swim in water!

Every pack you own has its own coloring book — find them under Printables in Wild Atlas.
The newsletter comes with a free one too: wildatlasapp.com/newsletter

Rabbits thump their back feet on the ground to warn other rabbits about danger.

A rabbit can run up to 45 miles per hour — that's faster than a car in your neighborhood!

They are most active at dawn and dusk, not in the middle of the day.

Rabbit

Wild Atlas

Hamsters wash their faces with their tiny paws just like cats do.

A hamster can remember where it hid food weeks ago.

Baby hamsters are born without any fur and their eyes stay closed for two weeks.

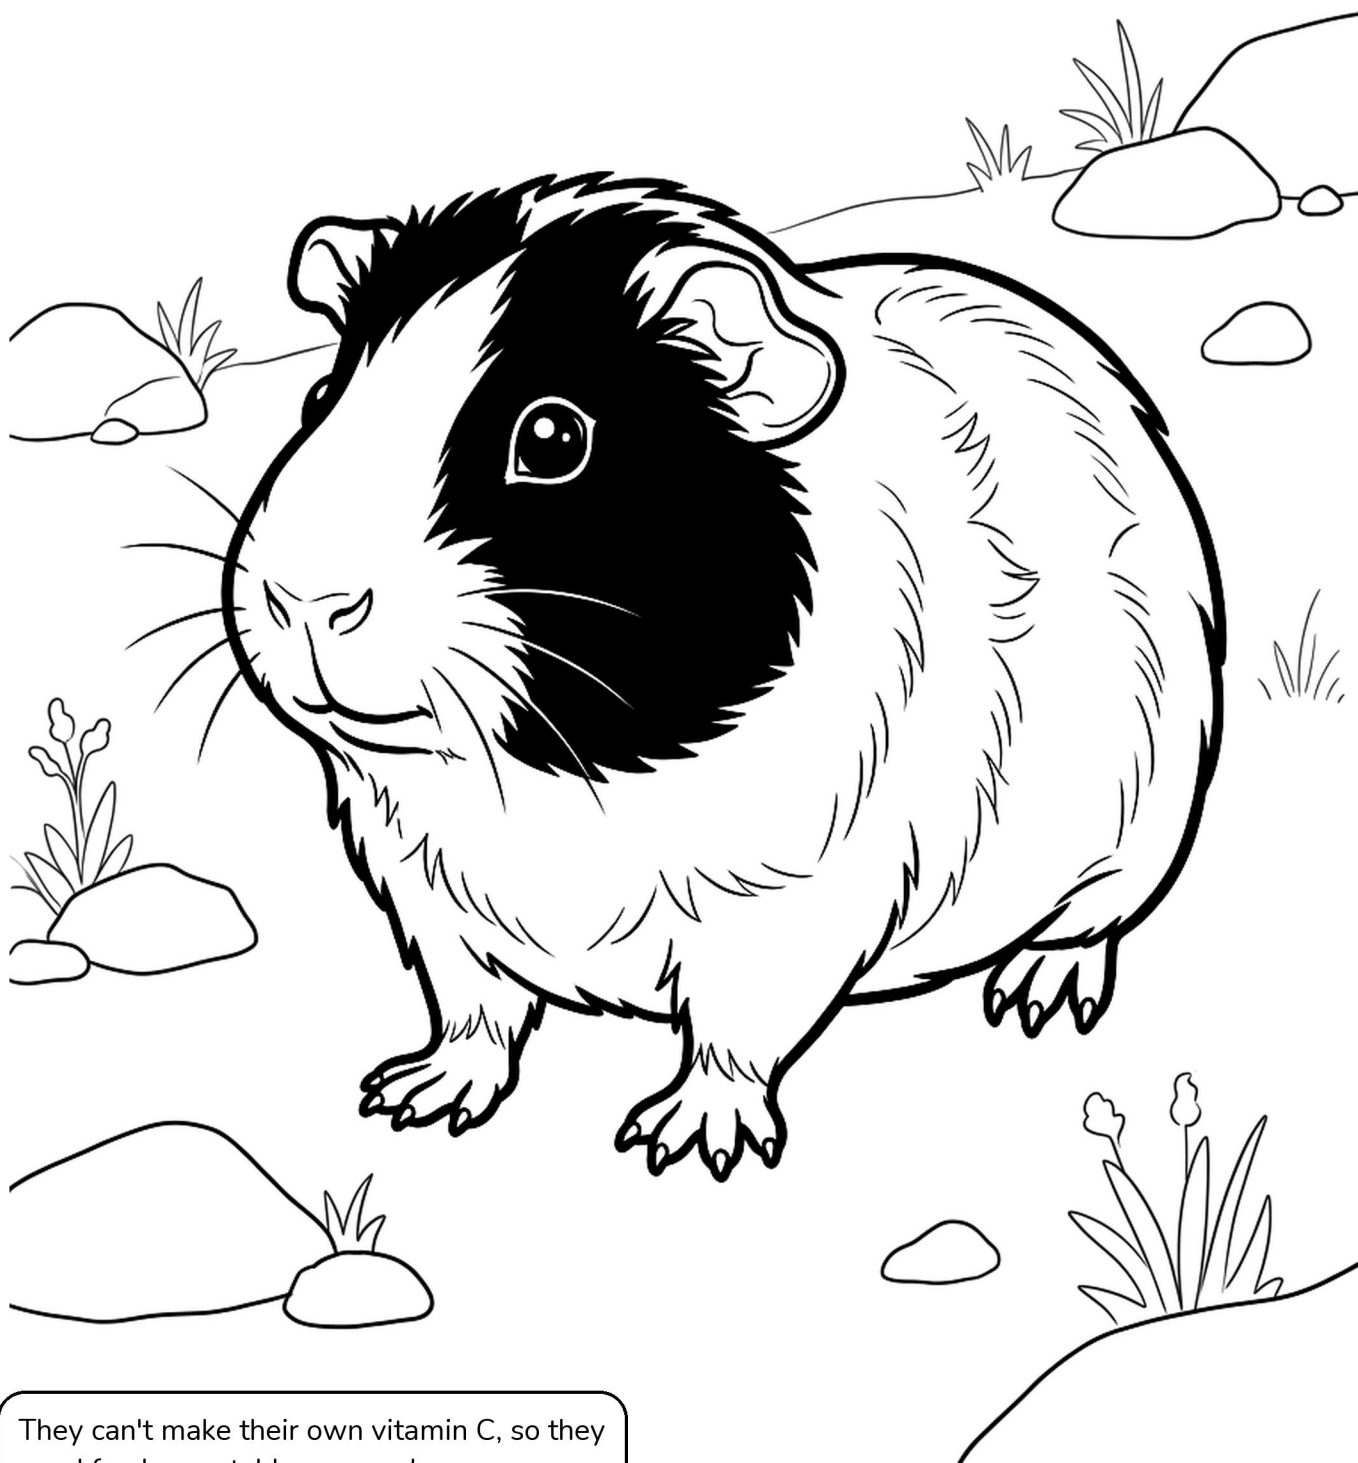

Hamster

Wild Atlas

Guinea pigs 'popcorn' when they're happy — they jump straight up in the air and twist!

Their teeth never stop growing, so they need to chew on hay all day to keep them short.

They can't make their own vitamin C, so they need fresh vegetables every day.

Guinea Pig

Wild Atlas

Ferrets love to steal and hide shiny things like keys and socks.

They can run backwards almost as fast as forwards.

They have a musky smell that some people love and some people don't.

Ferret

Wild Atlas

Chinchillas eat plants, bark, and seeds with their strong front teeth that never stop growing.

They use their long whiskers to feel their way around in the dark mountain caves where they live.

Baby chinchillas are called kits and are born with fur and open eyes.

Chinchilla

Wild Atlas

Gerbils groom each other to show friendship and keep their fur clean.

A gerbil can live its whole life without taking a bath — they clean themselves!

They love to chew because their teeth never stop growing.

Gerbil

Wild Atlas

Mice are fantastic climbers and can run up walls and along wires.

A mouse's heart beats about 600 times every minute — that's ten times faster than yours!

Mice are very clean animals and groom themselves many times each day.

Mouse

Wild Atlas

A rat's teeth never stop growing, so they have to chew on things to keep them short.

Rats are super clean animals and spend hours every day grooming themselves and their friends.

They can squeeze through holes as small as a quarter because their bodies are very bendy.

Rat

Wild Atlas

Hedgehogs snuffle and snort as they hunt for food at night.

Their spines are actually modified hairs made of keratin.

A hedgehog can run as fast as you can walk.

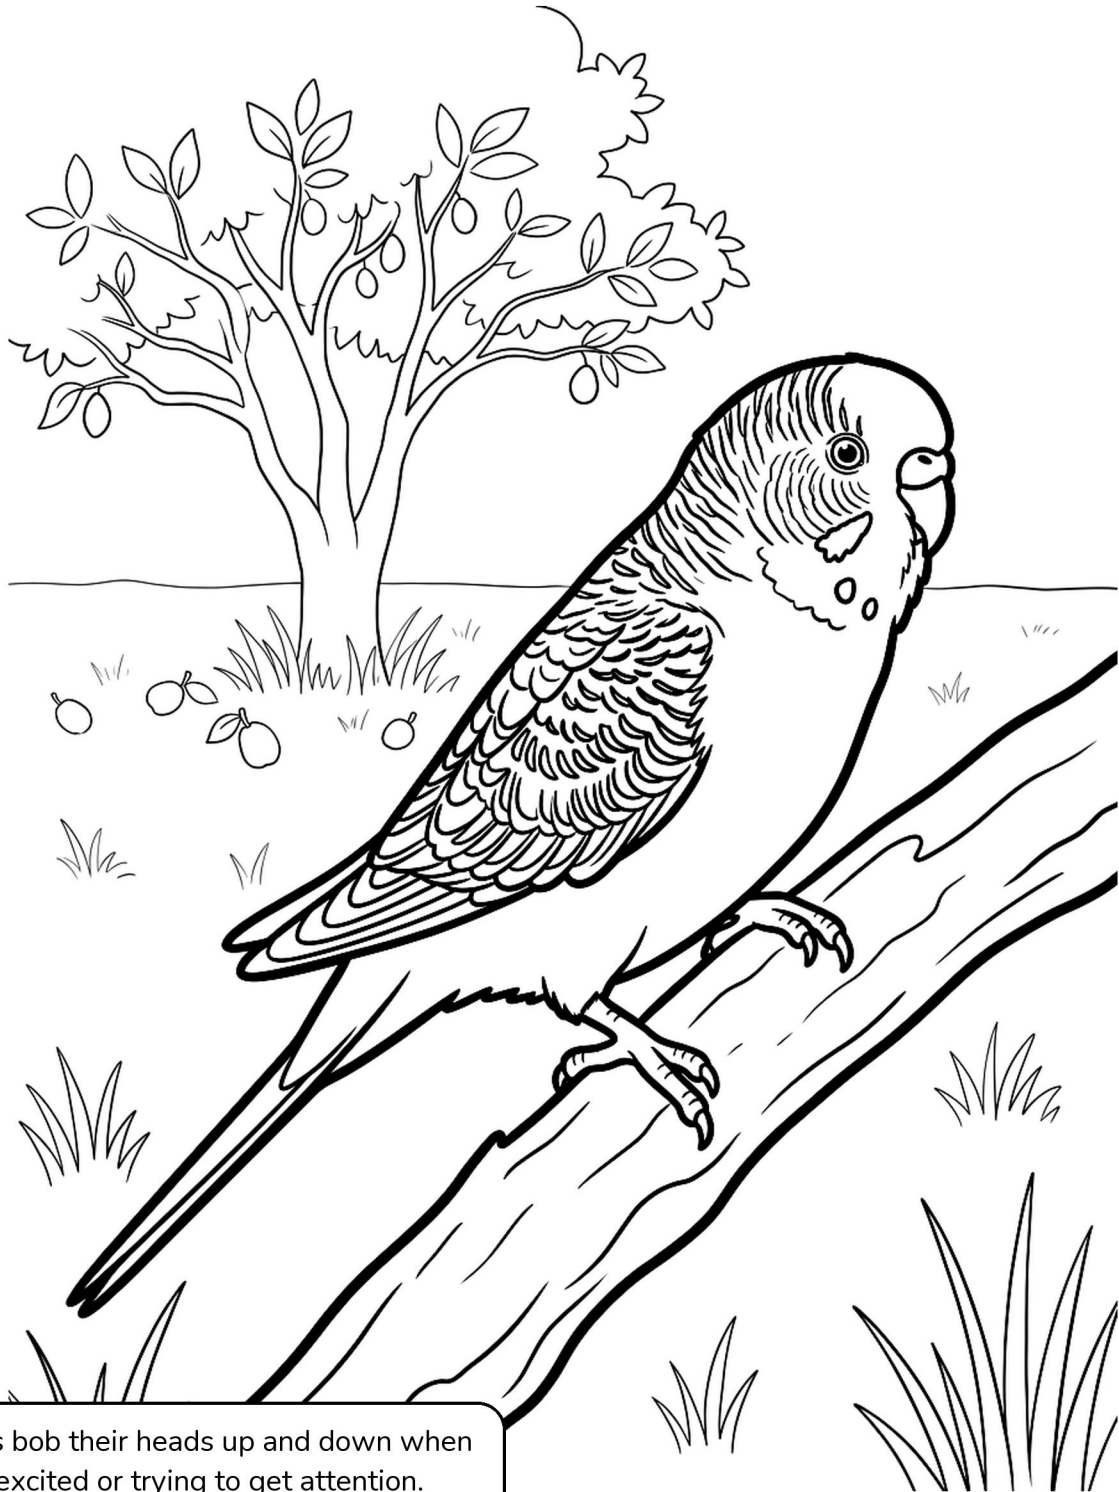

Hedgehog

Wild Atlas

Budgies grind their beaks when they're happy and relaxed, like a cat purring.

Male budgies have blue noses, and female budgies have brown or pink noses.

Budgies bob their heads up and down when they're excited or trying to get attention.

Parakeet (Budgie)

Wild Atlas

Cockatiels fly super fast — up to 40 miles per hour in the wild.

They love to sit on the highest perch they can find.

They eat mostly seeds and grass in the wild.

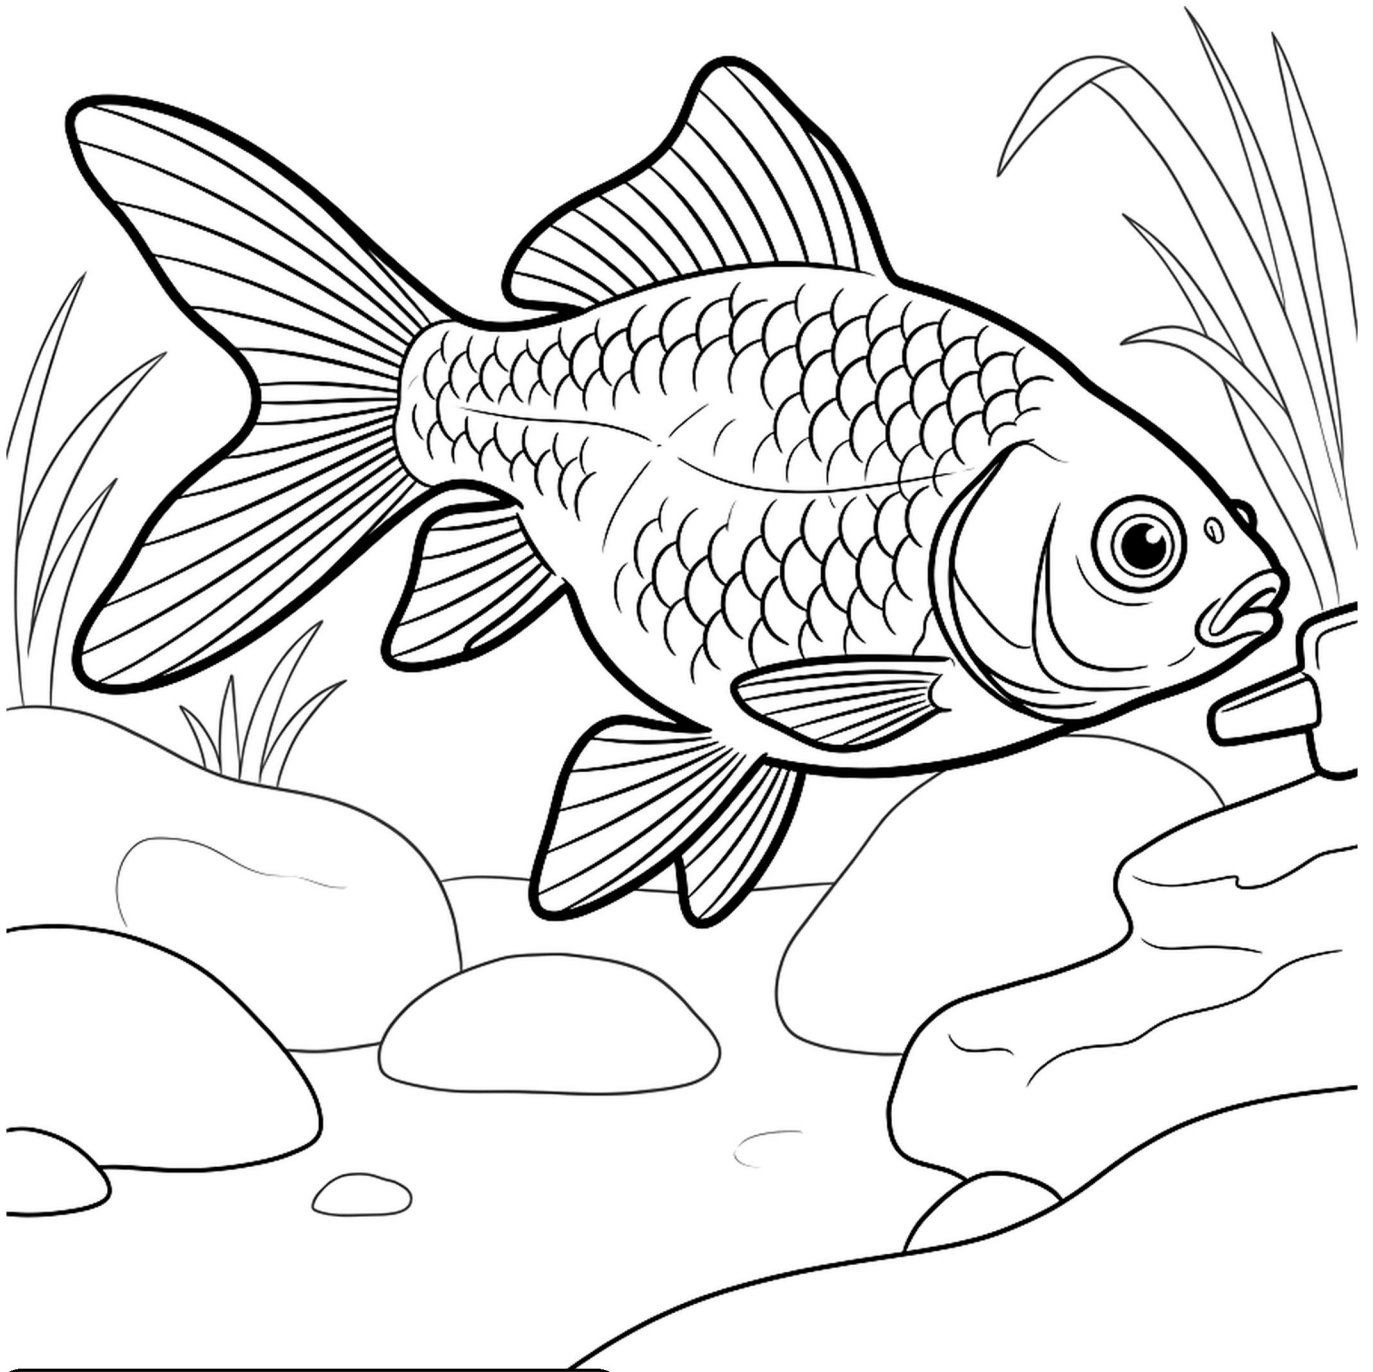

Cockatiel

Wild Atlas

Goldfish can see more colors than humans can — they can even see ultraviolet light.

A goldfish's memory lasts at least three months, not three seconds like people think.

They sleep with their eyes open because they don't have eyelids.

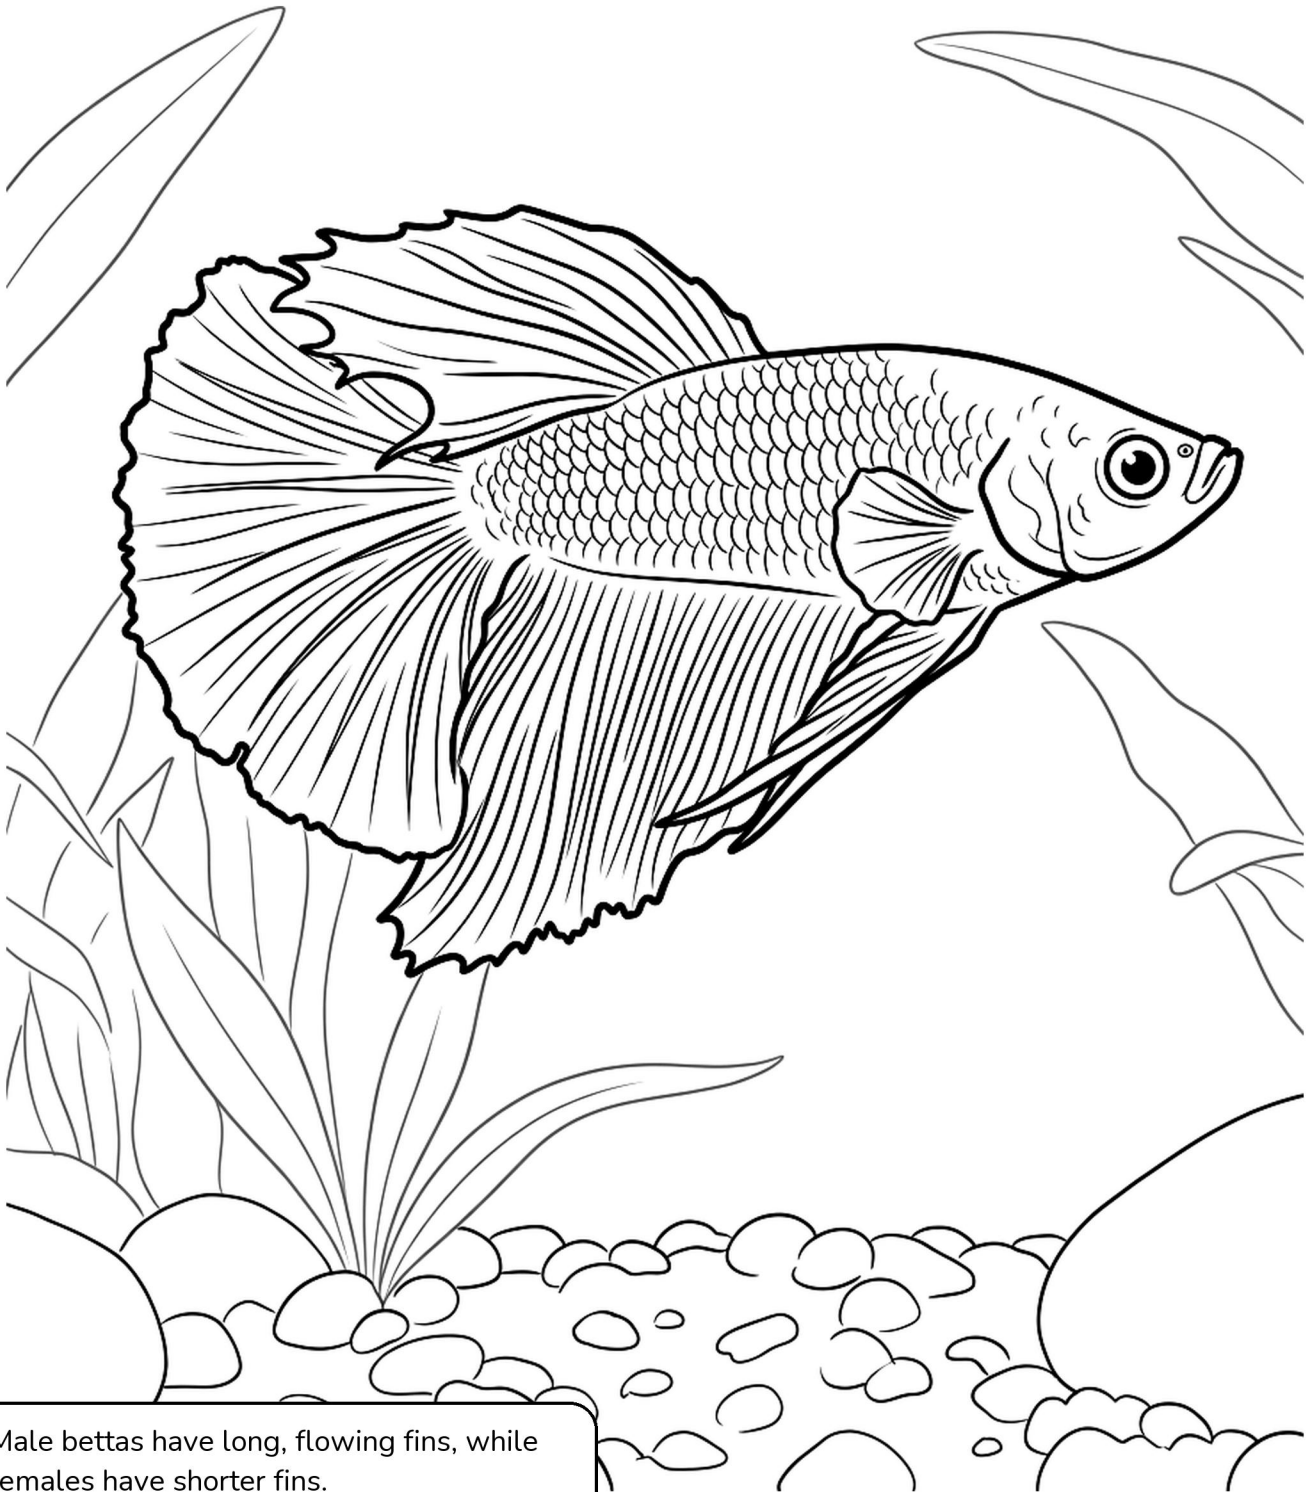

Goldfish

Wild Atlas

Betta fish flare their fins and gills to look bigger when they feel threatened.

They can live in tiny spaces like rice paddies because they breathe air from the surface.

Male bettas have long, flowing fins, while females have shorter fins.

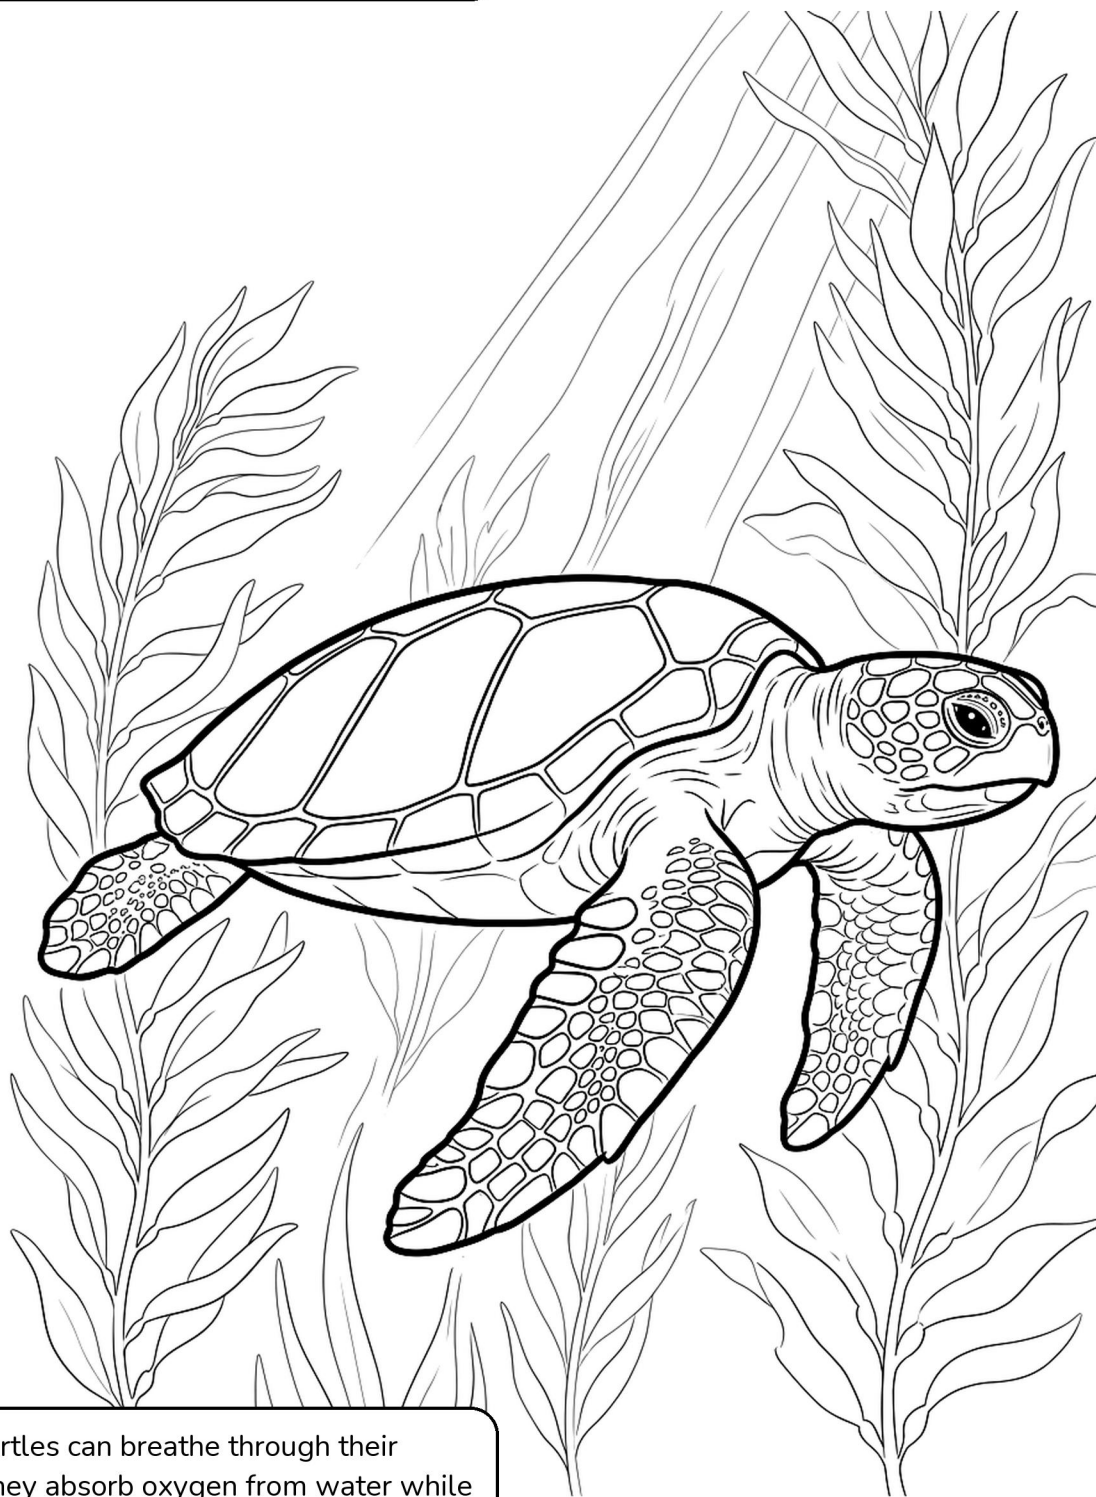

Betta Fish

Wild Atlas

Turtles can't stick their heads out of their shells if the shell is too small — the shell grows with them!

A turtle's shell can feel touch — if you tap it gently, the turtle knows you're there.

Some turtles can breathe through their butts! They absorb oxygen from water while hibernating underwater.

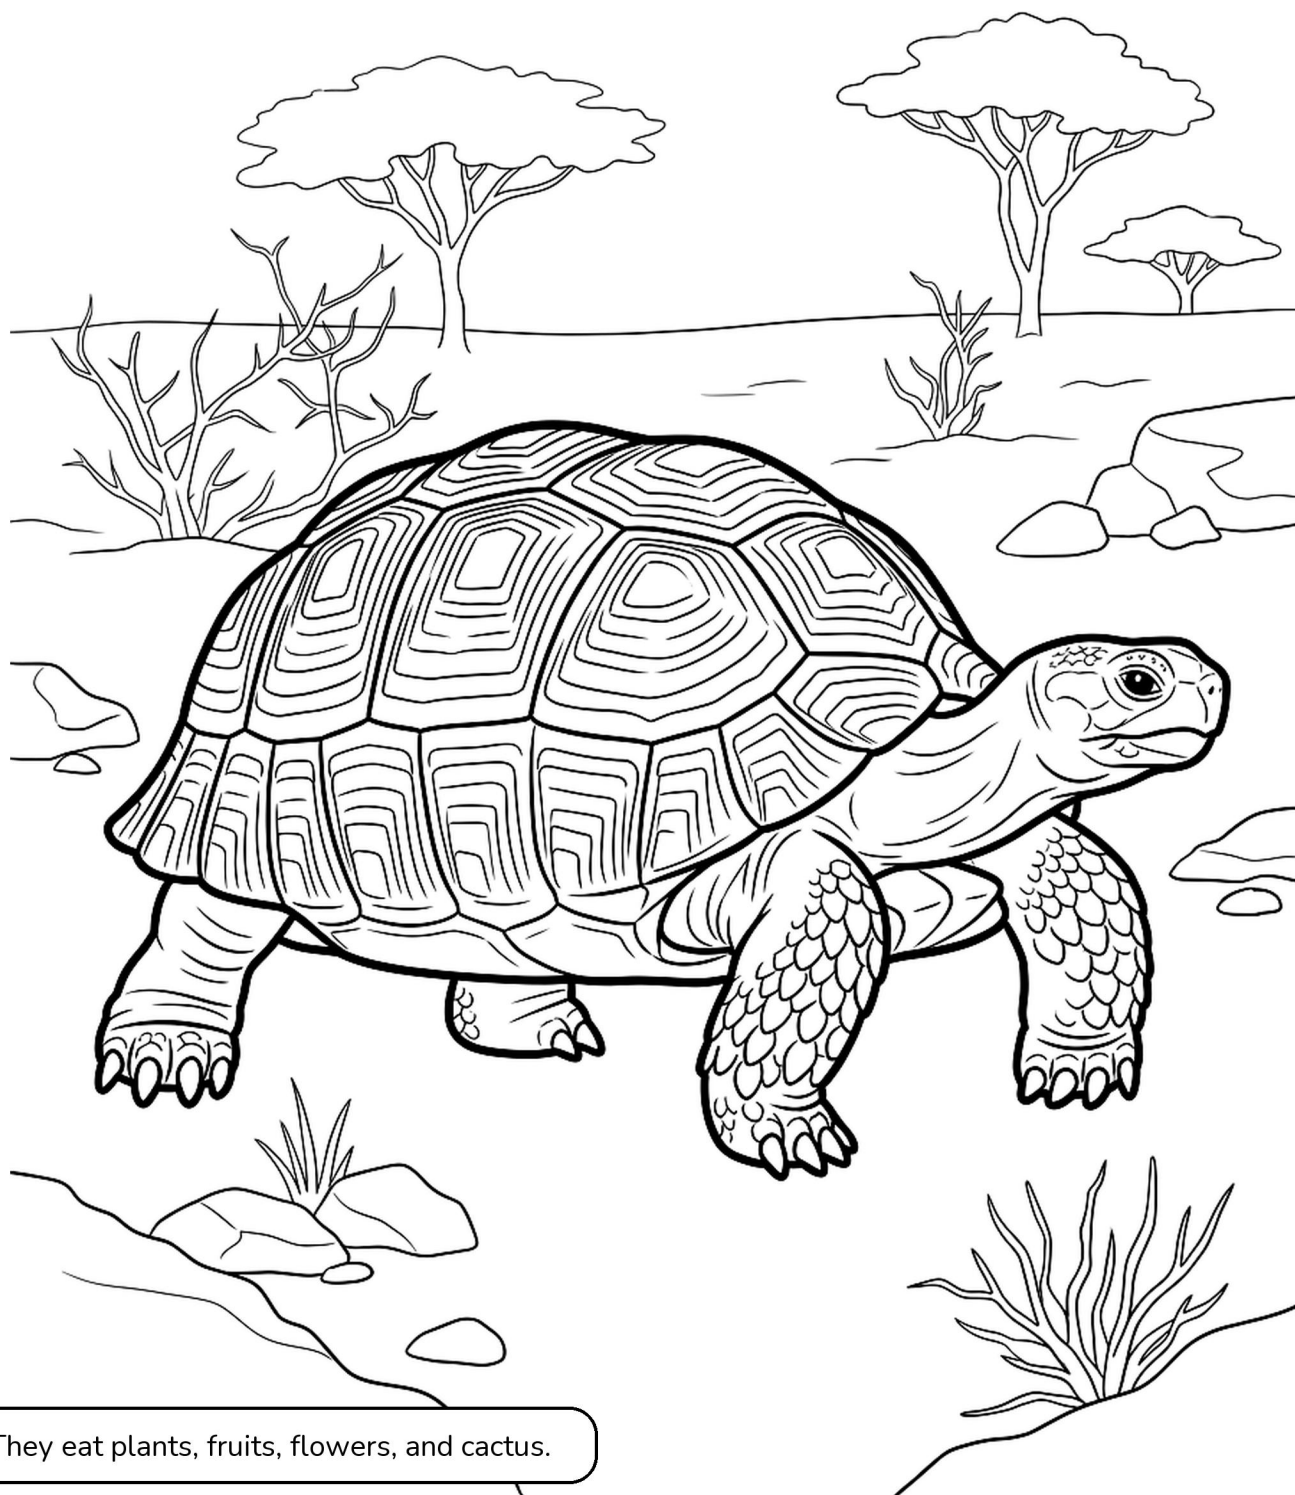

Turtle

Wild Atlas

Tortoises walk very slowly — only about 0.3 kilometers per hour!

Their shells are made of over 50 bones all joined together.

They eat plants, fruits, flowers, and cactus.

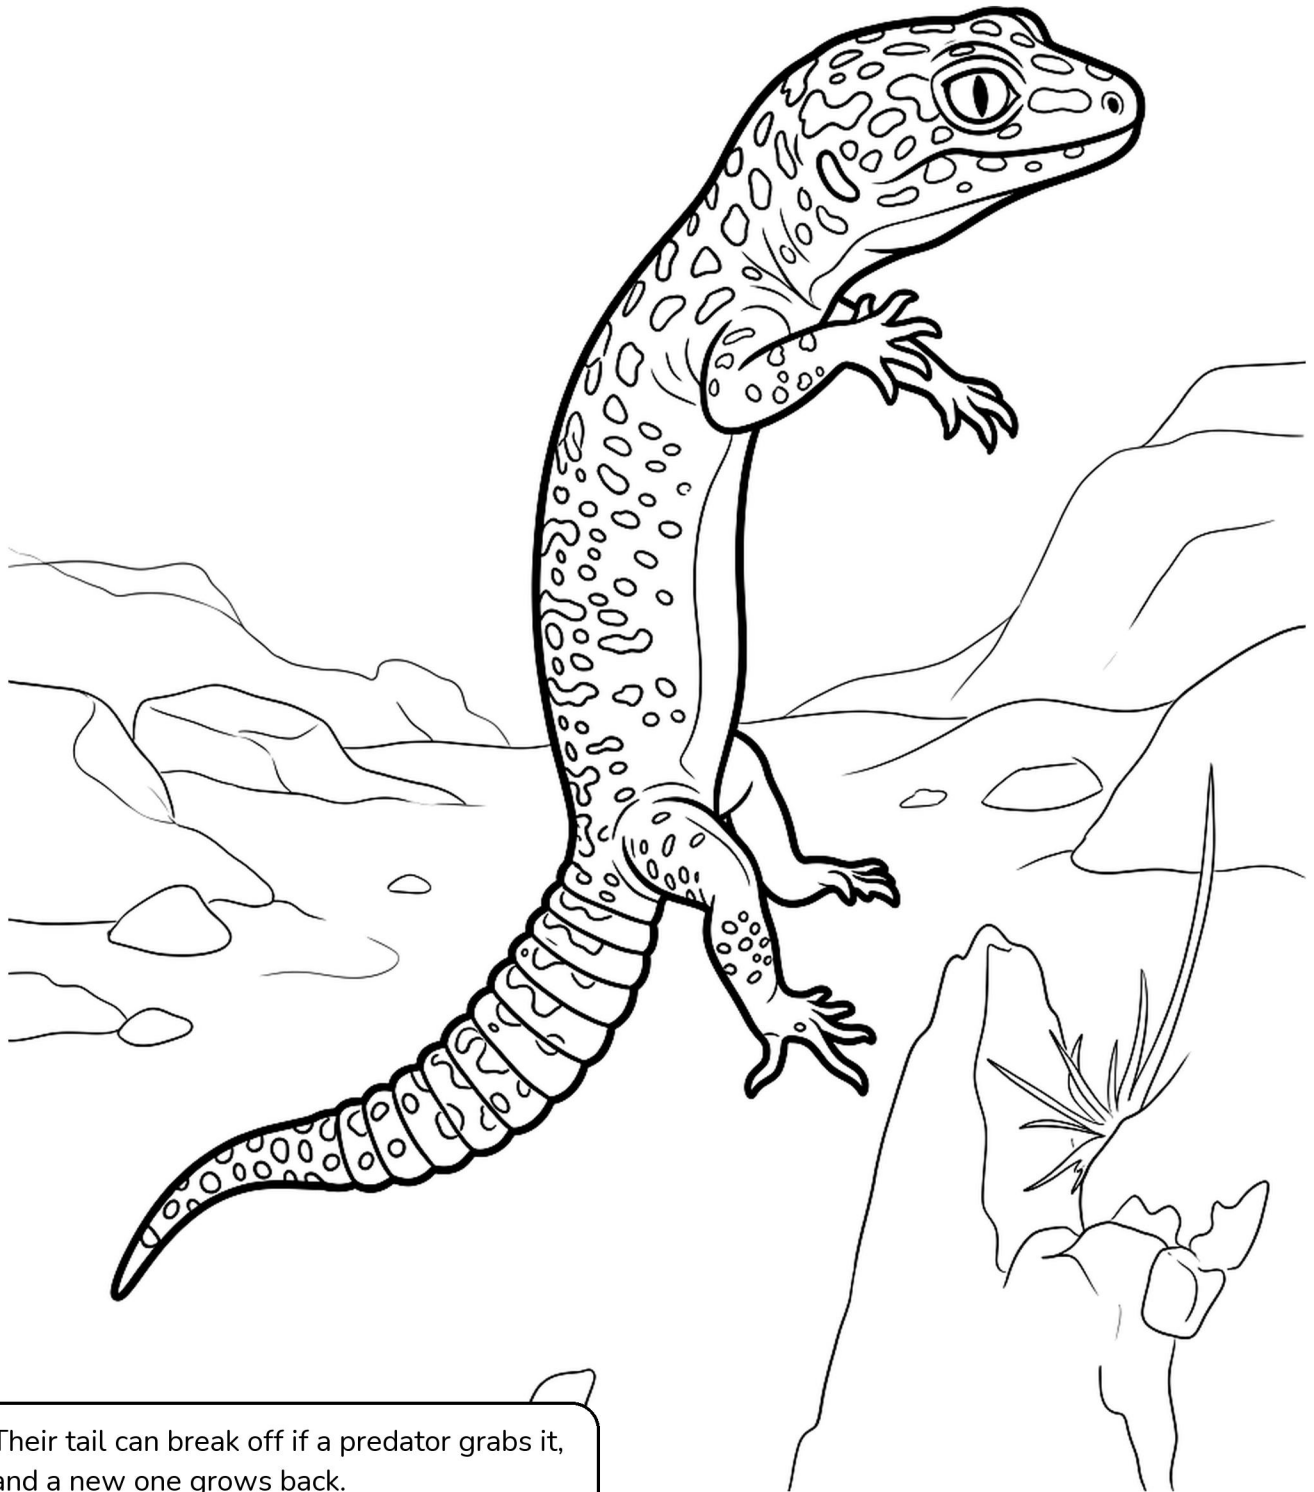

Tortoise

Wild Atlas

Leopard geckos hunt at night when the desert cools down.

They wave their tail back and forth before pouncing on prey to get ready for the jump.

Their tail can break off if a predator grabs it, and a new one grows back.

Leopard Gecko

Wild Atlas

A hermit crab's body is soft and curly so it fits perfectly inside a spiral shell

Hermit crabs have two different-sized claws — one big claw blocks the shell opening like a door

They walk sideways carrying their heavy shell home on their back

Hermit Crab

Wild Atlas

Mini pigs don't sweat, so they roll in mud to cool down.

They make over 20 different sounds to talk to each other.

A mini pig's snout is so strong it can move heavy objects.

Miniature Pig

A Note From Our Founder

Thank you for printing this out. My daughter Zuzu recently found a bird trapped in our house. Without anyone asking her to, she walked up slowly, cupped it gently in her hands, and let it go outside. That's the whole reason Wild Atlas exists — the more we can nurture that kind of curiosity and care in kids, the more likely they are to grow up protecting the animals they love. Coloring is something kids already love doing — we just wanted to give the animals they're learning about in the app a life outside the screen too. If you'd like more of this — new packs, free printables like this one, the occasional good animal fact — join our newsletter below. — Josh, Wild Atlas
