

Wild Atlas

Coloring

Book

It wasn't discovered by scientists until 1992, which makes it one of the newest big animals we've ever found.

It has two long, straight horns that grow on both boys and girls.

It lives only in the misty Annamite Mountains between Laos and Vietnam, and nowhere else on Earth.

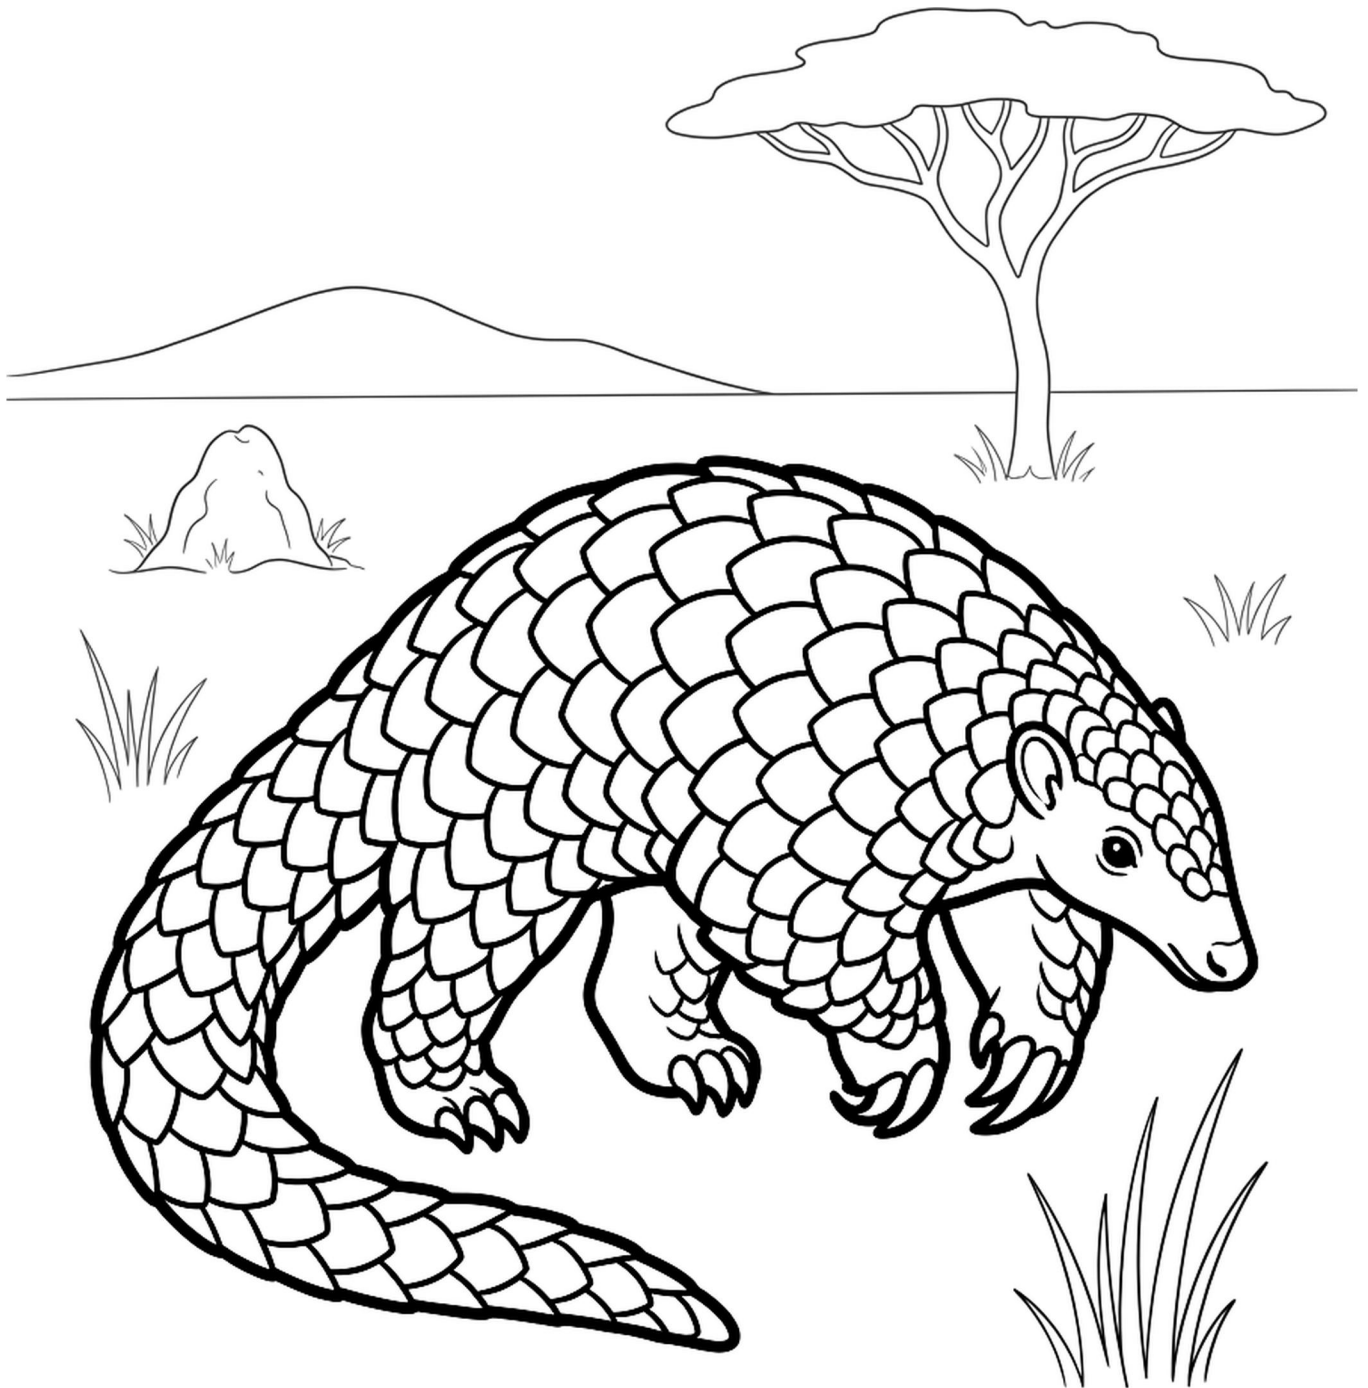

Saola

Wild Atlas

Its scales are made of the same stuff as your fingernails, and they cover it like overlapping armour.

When something startles it, it rolls into a tight ball so only its hard scales show.

Its sticky tongue is longer than its whole body — perfect for slurping ants out of their nests.

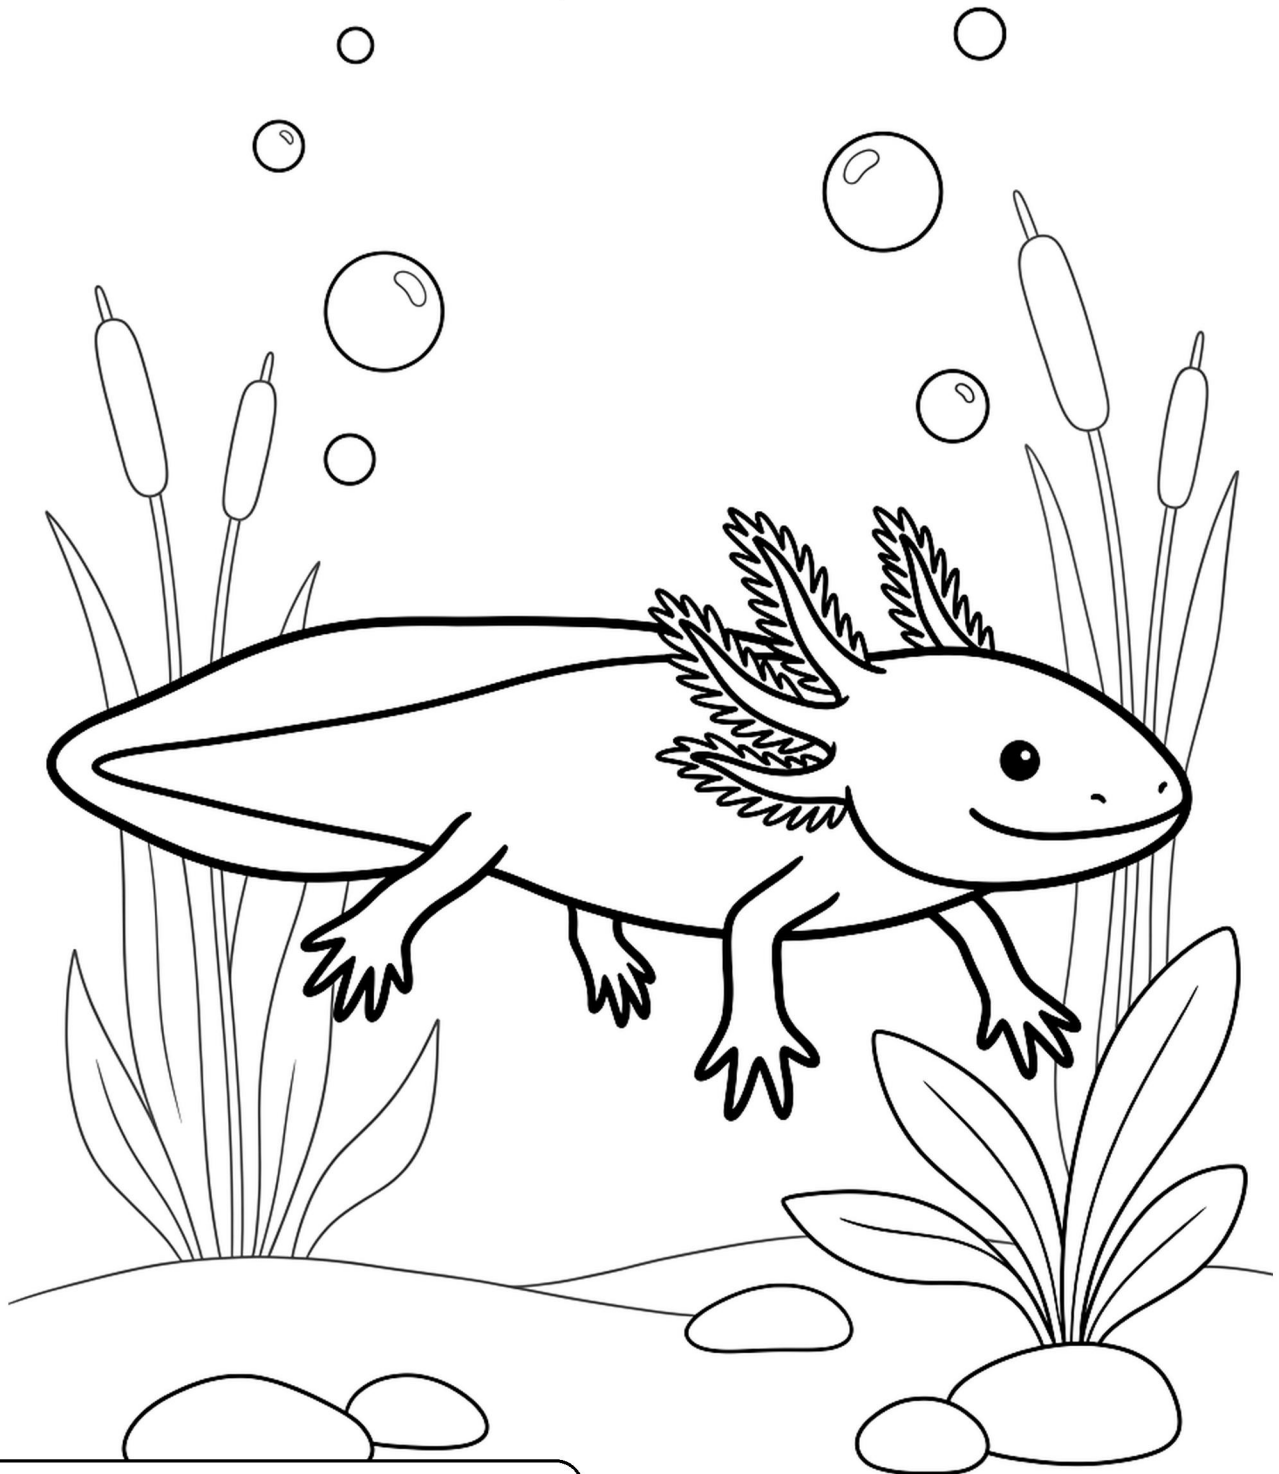

Pangolin

Wild Atlas

Those feathery pink branches around its head are gills, and that's how it breathes underwater.

If it loses a leg, a tail, or even a piece of its heart, it can grow a perfect new one.

Its mouth curves up at the corners, so it always looks like it's smiling at you.

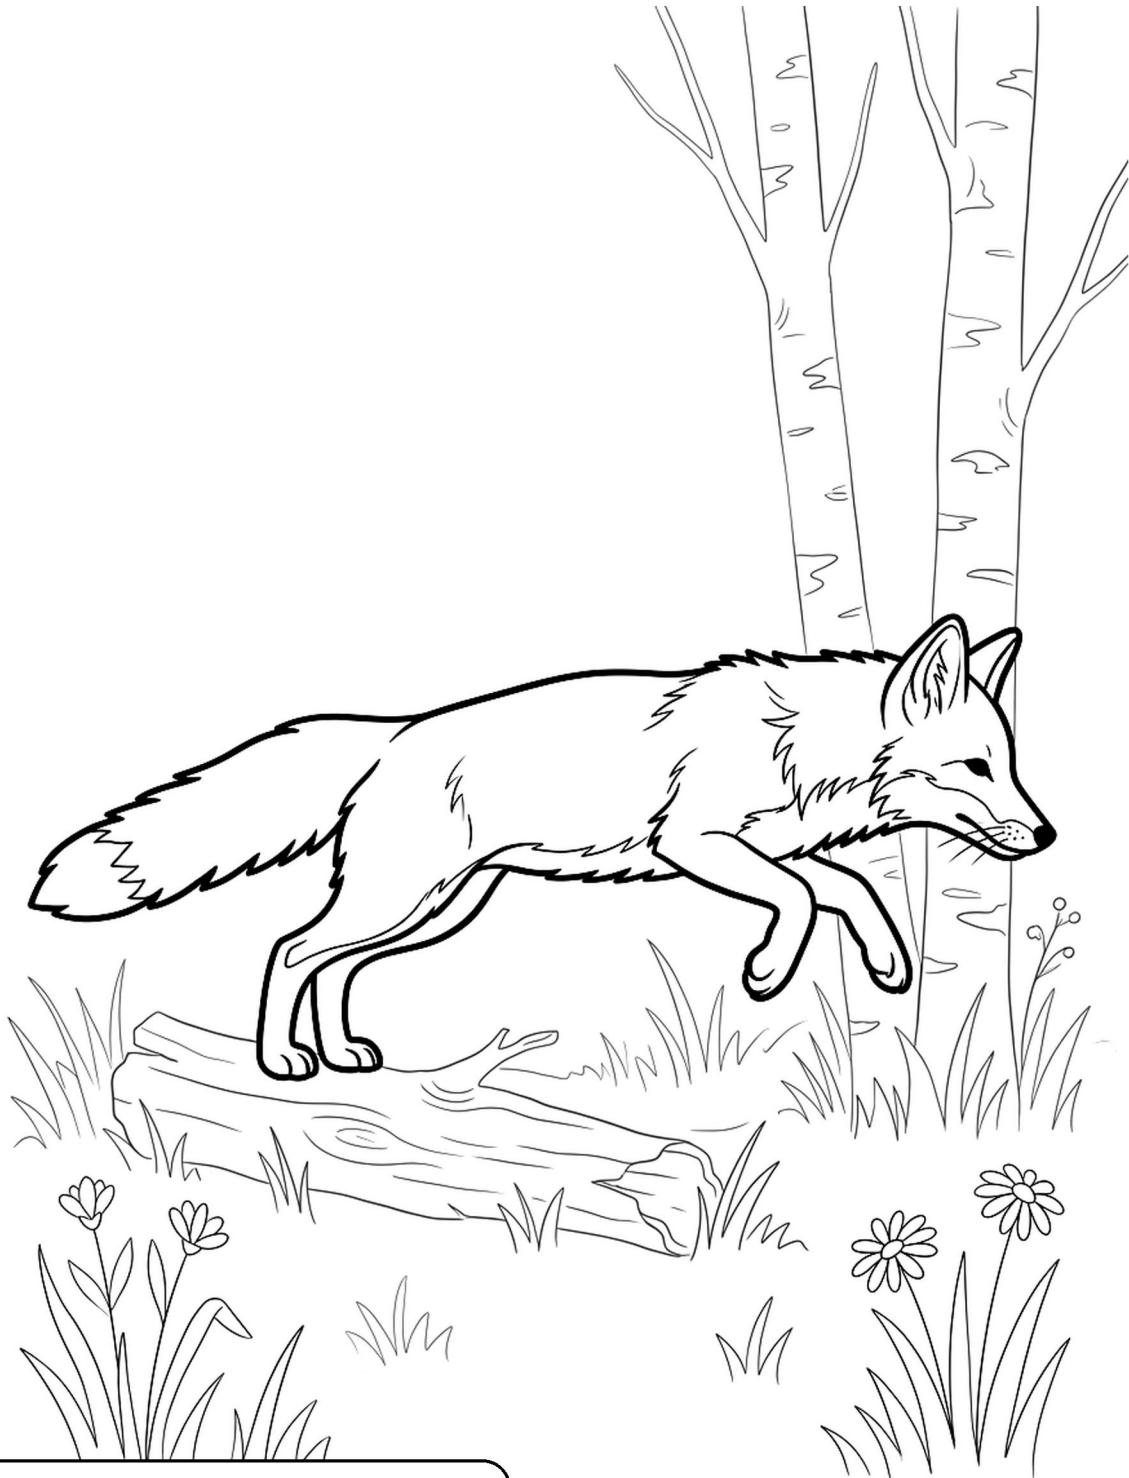

Axolotl

Wild Atlas

They make over 40 different sounds to talk to each other.

They wrap their bushy tails around themselves like a blanket to stay warm in winter.

They are great jumpers and can leap over fences taller than a grown-up.

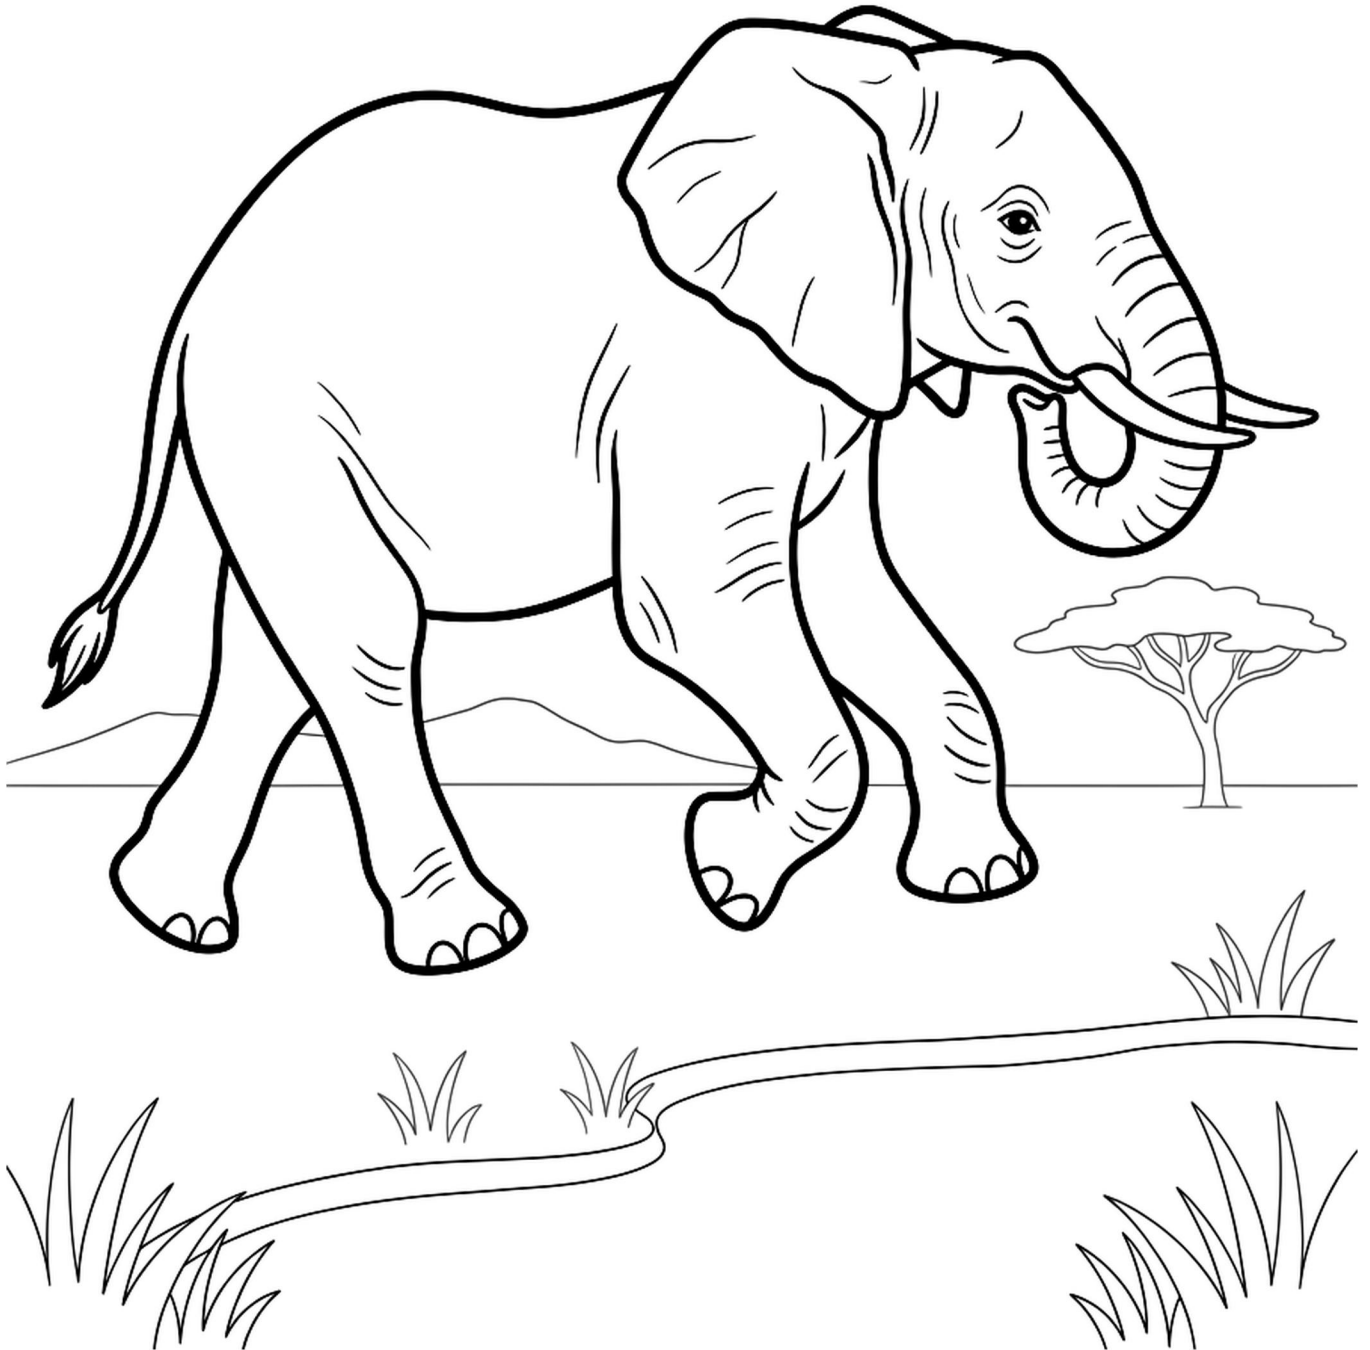

Red Fox

Wild Atlas

An elephant's tusks are actually giant teeth that never stop growing.

Elephants love taking mud baths to protect their skin from sunburn and bug bites.

Elephants remember their friends and family for their whole lives and show love by wrapping trunks together.

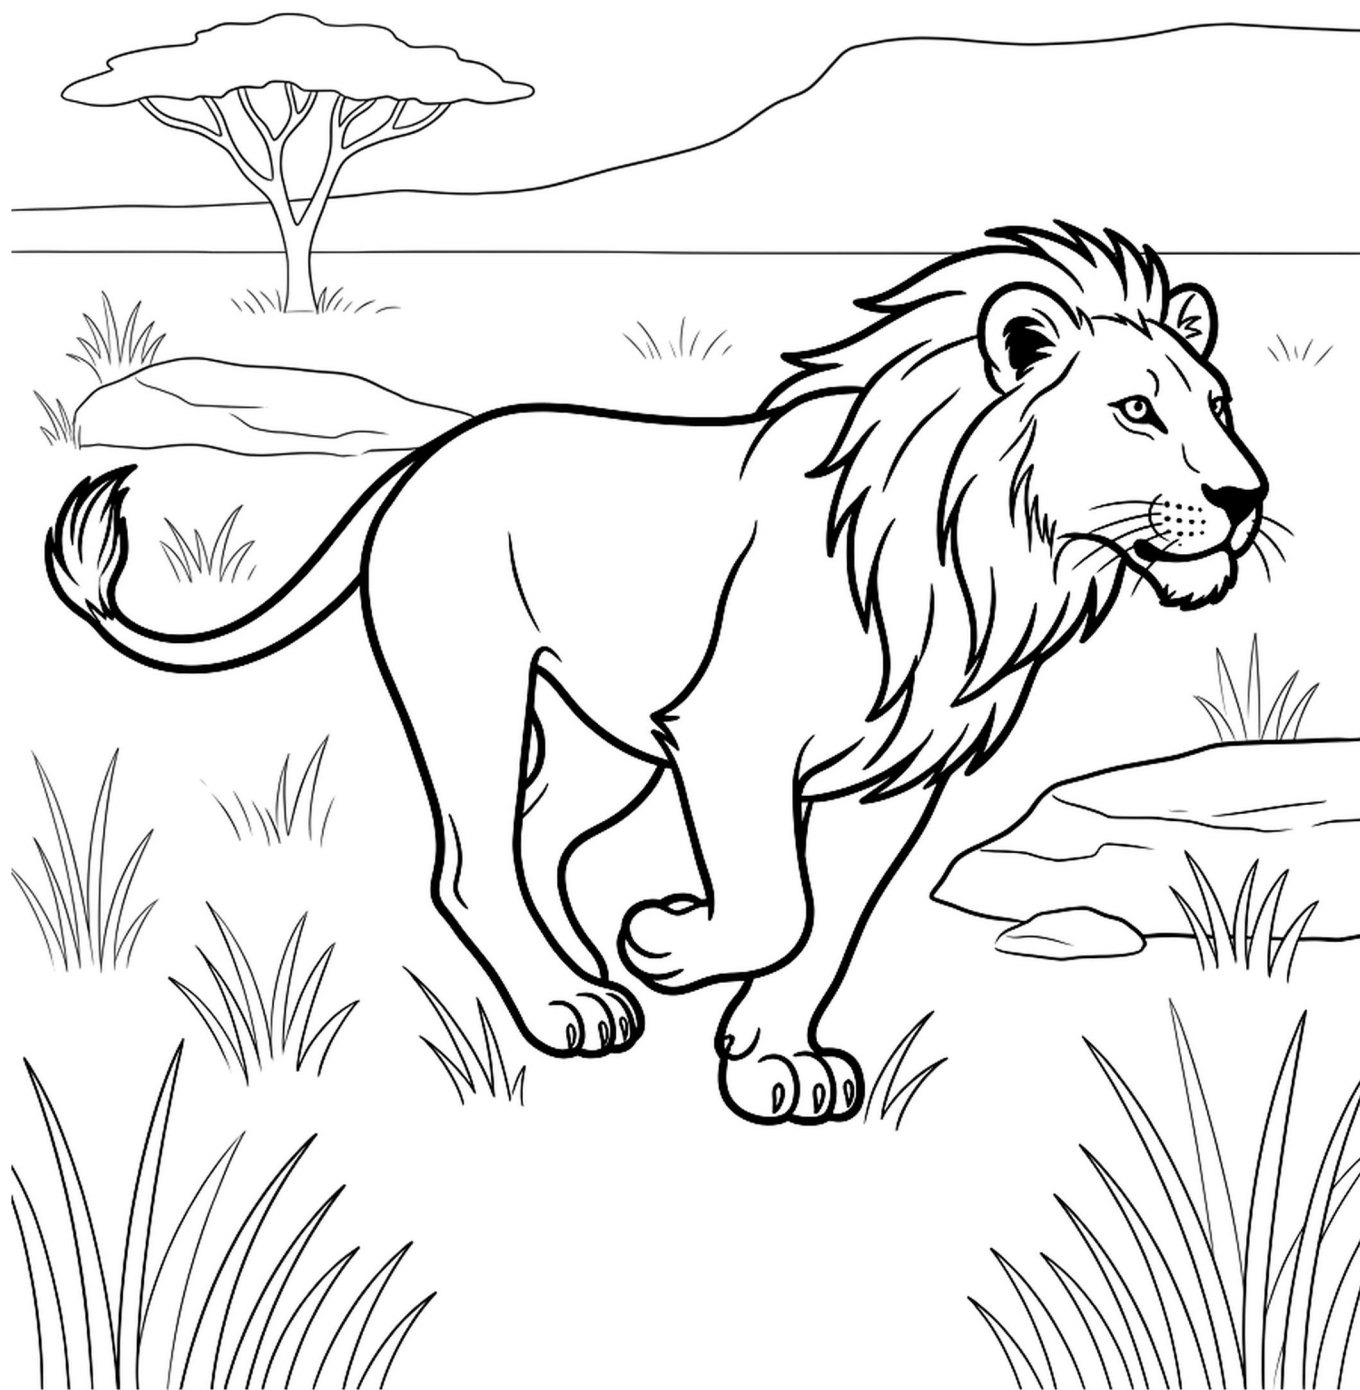

African Elephant

Wild Atlas

A lion's tongue is so rough it can lick meat right off a bone.

They're the second biggest cats in the world — only tigers are bigger.

A pride can have up to 40 lions living together like one big family.

Lion

Wild Atlas

A Note From Our Founder

Thank you for printing this out. My daughter Zuzu recently found a bird trapped in our house. Without anyone asking her to, she walked up slowly, cupped it gently in her hands, and let it go outside. That's the whole reason Wild Atlas exists — the more we can nurture that kind of curiosity and care in kids, the more likely they are to grow up protecting the animals they love. Coloring is something kids already love doing — we just wanted to give the animals they're learning about in the app a life outside the screen too. If you'd like more of this — new packs, free printables like this one, the occasional good animal fact — join our newsletter below. — Josh, Wild Atlas
